

1. Construct the locus of points that are at a distance equal to the length of the given line segment a from the given point P .

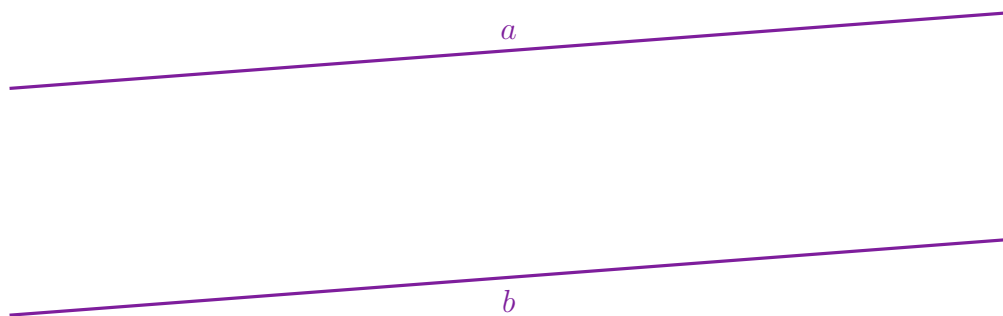

2. Construct the locus of points that are at a the distance equal to the length of the given line segment a from the given line b .

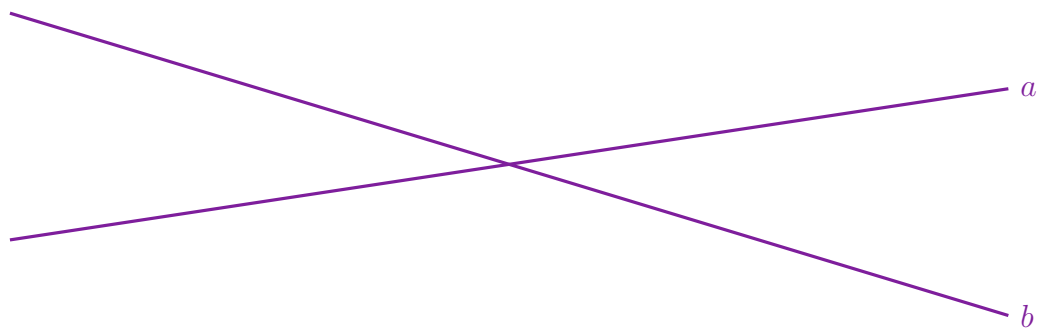

3. Construct the locus of points that are equidistant from the two given points.

4. Construct the locus of points that are equidistant from the two given parallel lines.

5. Construct the locus of points that are equidistant from the two given intersecting lines.

6. Construct a triangle whose sides have the following lengths.

(a) unknown:

(b) data:

7. Given a fixed line segment AB and a fixed angle $\angle C$, construct the locus of points C such that $\angle ACB$ is equal to the given angle.
